

Peer Review №2: OMS on DVT

Nikolay Kozyrskiy, Gleb Balitskiy

April 2021

1. **Code Review**

Some PEP8 style fixes were made. Both cpu and gpu are now supported: we changed `.cuda()` to `.to(device)`, where device can be 'gpu' or 'cpu'. Some unused variables were removed. Path to TB logs is moved to args instead of hard-coded one. One TODO is added to fix the unimplemented function. The structure of the project is not very clear now and there are a lot of unrefactored pieces of code.

2. **Project Readiness** We managed to run the baseline which gave us correct reproducible results although it was not obvious how to do it. The project is close to the final stage, we estimate the readiness at 80%. Some refactoring and clear documentation coverage are needed. The link to pull request is [here](#).
